

Product Monitor is Anchor Software's data repository that captures user and run-time information, and other statistics and data from Anchor solutions. Users can create a global view of the data processed through every Anchor solution and every job. The information in the data repository can be used for deep-dive analysis and reporting, and to trigger other internal processes. Companies who use Product Monitor can also leverage it for internal departmental billing, where Anchor products are being used only by specific departments or divisions.

All information in the data repository is displayed on an easy-to-read, 2 section Dashboard. Section one is the overview of live and archived jobs for each Anchor solution. Section two is where the user can view the real-time status of each active job. Users then select the View Jobs button to view individual product info.

Product Monitor:

- Provides customers with a global view of their data - including tracking for every job process.
- Allows the user to review all executed and archived jobs via a web-based dashboard.
- Captures Server details, such as operating system, number of cores, and processor type(s).
- Captures username details on who submitted a job.
- Records useful details about the run process (what processed, product version number, when it processed, when it ended and how long it took).
- Captures real-time information on JobID, description, date, start time, end time, etc.
- Records statistics that are written to hardcopy reports, allowing the creation of ad-hoc reports.
- Provides the ability to write to MySQL, MSSQL, and SQLITE.
- Reports the performance of the following Anchor Software products:

PM Identity	Job ID	Job Description	Job Name	Product Name	Product Abbrev	Product Version	System Data Version	List Data Version	User Name	Machine Name	Event DateTime	Customer Name	Employee Name	Job
